Final Project Proposal

Smith-Waterman for Circular RNA Aligner

賴志杰、麥智詠、王晨峰

2022/06/22

https://github.com/CHIHCHIEH-LAI/HLS

Outline

- Smith-Waterman
- a first implementation
- systolic array architecture
- input compression
- shift register
- dual physical ports
- find max value index
- scalable design
- Future Work
 - Fully scalable design

Smith-Waterman Algorithm

設要比對的兩序列為 $A = a_1 a_2 \dots a_n$ 和 $B = b_1 b_2 \dots b_m$,其中n和m分別為序列A和B的長度。

- 1. 確定置換矩陣和空位罰分方法
 - 。 s(a,b) 組成序列的元素之間的相似性得分
 - 。 W_k 長度為k的空位罰分
- 2. 建立得分矩陣H並初始化其首行和首列。該矩陣的大小為n+1行m+1列(注意計數從0開始)。

$$H_{k0} = H_{0l} = 0, (0 \le k \le n, 0 \le l \le m)$$

3. 從左到右,從上到下進行打分,填充得分矩陣H剩餘部分

$$H_{ij} = \max egin{cases} H_{i-1,j-1} + s(a_i,b_j), \ \max_{k \geq 1} \{H_{i-k,j} - W_k\}, \ \max_{l \geq 1} \{H_{i,j-l} - W_l\}, \ 0 \end{cases} \quad (1 \leq i \leq n, 1 \leq j \leq m)$$

其中,

 $H_{i-1,j-1} + s(a_i,b_j)$ 表示將 a_i 和 b_j 比對的相似性得分,

 $H_{i-k,j}-W_k$ 表示 a_i 位於一段長度為k的刪除的末端的得分,

 $H_{i,j-l}-W_l$ 表示 b_j 位於一段長度為l的刪除的末端的得分,

0表示 a_i 和 b_j 到此為止無相似性。

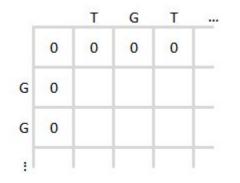

4. 回溯。從矩陣H中得分最高的元素開始根據得分的來源回溯至上一位置,如此反覆直至遇到得分為0的元素。

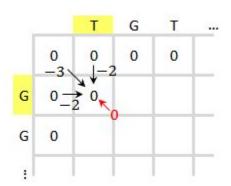

Smith-Waterman Score Matrix

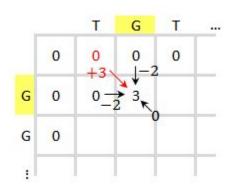

得分矩陣的作用是對兩序列中兩兩位置 進行打分以逐步記錄最佳比對。

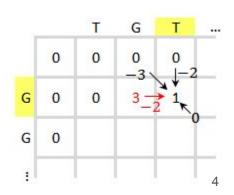

$$H_{ij} = \max egin{cases} H_{i-1,j-1} + s(a_i,b_j), & \ H_{i-1,j} - W_1, & \ H_{i,j-1} - W_1, & \ 0 & \ \end{pmatrix} = egin{cases} 1, & a_i = b_j \ -1, & a_i
eq b_j \ \end{pmatrix}$$

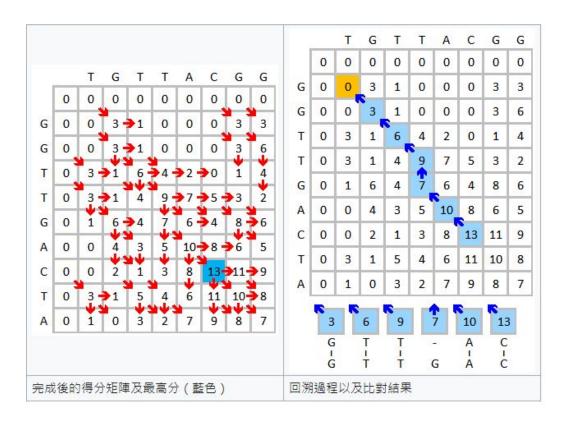

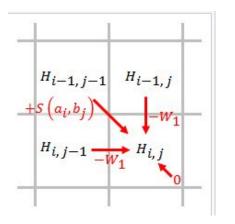

Smith-Waterman Traceback

constant

```
// scores used for Smith Waterman similarity computation
static const short GAP_i = -1;
static const short GAP_d = -1;
static const short MATCH = 2;
static const short MISS_MATCH = -1;
```

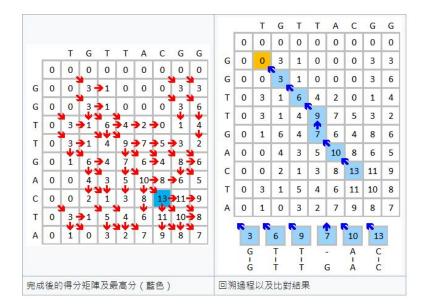

$$H_{ij} = \max egin{cases} H_{i-1,j-1} + s(a_i,b_j), \ H_{i-1,j} - W_1, \ H_{i,j-1} - W_1, \ 0 \end{cases} s(a_i,b_j) = egin{cases} 1, & a_i = b_j \ -1, & a_i
eq b_j \ \end{pmatrix}$$

空位罰分: GAP i = GAP d = -w1 = -1

元素之間的相似得分: Match = +S(ai, bj) = 2 or MISSMATCH = -S(ai, bj) = -1

constant

```
// directions codes
static const int CENTER = 0;
static const int NORTH = 1;
static const int NORTH_WEST = 2;
static const int WEST = 3;
```

用來記錄得分來源,並儲存結果於direction_matrix

A first implementation

```
20 Evoid compute matrices (

                                  max value = val;
```

T G T T A C G G

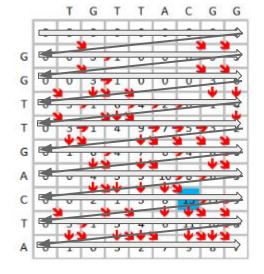

A first implementation

Name	Issue Type	Latency (cycles)	Latency (ns)	Iteration Latency	Interval	Trip Count	Pipelined	BRAM	BRAM (%)	DSP	DSP (%)	FF	FF (%)	LUT	LUT (%)	Slack
compute_matrices	II Violation	584786	1.949E6		584787		no	2	~0	0	0	2228	~0	3748	~0	0.00
C VITIS_LOOP_53_1	II Violation	584714	1.949E6	148	145	4032	yes									

在最初版本中,每次只計算陣列中的一個值,共需要64x64個cycles,效率極低。

每個cycle中, 讀取資料都要透過m-axi向memory讀取, 因此需要每次cycle需要大量

時間在資料傳輸。

```
char string1[N];
104
     #pragma HLS ARRAY PARTITION variable=string1 complete dim=1
        char string2[DATABASE SIZE];
     #pragma HLS ARRAY PARTITION variable=string2 complete dim=1
     // short direction matrix[DIRECTION MATRIX SIZE];
     //#pragma HLS ARRAY PARTITION variable=direction matrix complete dim=1
                                                                                  先將由AXI-master傳輸的guery和database儲
        memcpy(string1, string1 q, N*sizeof(char));
                                                                                  存於FPGA上的string1與string2。
        memcpy(string2, string2 g, DATABASE SIZE * sizeof(char));
114
        int north[N+1];
     #pragma HLS ARRAY PARTITION variable=north complete dim=1
        int west[N+1];
                                                                                       方向只有3種可能值,因此只需2bit即可表達。
     #pragma HLS ARRAY PARTITION variable=west complete dim=1
        int northwest[N+1];
     #pragma HLS ARRAY PARTITION variable=northwest complete dim=1
121 🗐/*
        short directionDiagonal[N];
                                                                                                                  database
    #pragma HLS ARRAY PARTITION variable=directionDiagonal complete dim=1
124
        ap uint<512> compressed diag[1];
                                                                                                    strina1
        init dep for: for (int i = 0; i \le N; i++) {
            north[i] = 0;
            west[i] = 0;
            northwest[i] = 0;
                                                                                          由於反對角線方向的運算彼此不相關. 因此可
134
        int directions index = 0;
                                                                                          以同時進行。
        num diag for: for(int num diagonals = 0; num diagonals < N + M - 1; num diagonals++){
     #pragma HLS inline region recursive
     #pragma HLS PIPELINE
140
            calculate diagonal (num diagonals, string1, string2, northwest, north, west, directions index, compressed diag);
            store diagonal (directions index, direction matrix q, compressed diag);
            directions index ++;
```

kernel寫2 bit值可用range 當Left variable

計算三種可能的value

```
33 Evoid calculate diagonal (int num diagonals, char string1[N], char string2[DATABASE SIZE],
         int databaseLocalIndex = num diagonals;
         int from, to;
         from = N * 2 - 2;
         to = N * 2 - 1;
        calculate diagonal for: for (int index = N - 1; index >= 0; index --) {
41
             int val = 0;
            unsigned int q = string1[index];
            unsigned int db = string2[databaseLocalIndex];
45
             if(num diagonals < N - 1 && databaseLocalIndex < N - 1 - num diagonals) db = 9;
48
             const short match = (g == db) ? MATCH : MISS MATCH;
             const short val1 = northwest[index] + match;
             const short val2 = north[index] + GAP d;
             const short val3 = west[index] + GAP i;
```

why loop starts from N-1?

取三種value最大者

```
if (val1 > val && val1 >= val2 && val1 >= val3) {
54
                 //val1
                 northwest[index + 1] = north[index];
                 north[index] = val1:
                 west[index + 1] = val1;
                 compressed diag[0].range(to,from) = NORTH WEST;
                 directionDiagonal[index] = NORTH WEST;
             } else if (val2 > val && val2 >= val3) {
61
                 //val2
62
                 northwest[index + 1] = north[index];
63
                 north[index] = val2;
                 west[index + 1] = val2;
64
                 compressed diag[0].range(to,from) = NORTH;
                 directionDiagonal[index] = NORTH;
67
             }else if (val3 > val) {
                 //val3
                 northwest[index + 1] = north[index];
                 north[index] = val3;
                 west[index + 1] = val3;
                 compressed diag[0].range(to,from) = WEST;
                 directionDiagonal[index] = WEST;
74
             }else{
                 //val
                 northwest[index + 1] = north[index];
                 north[index] = val;
                 west[index + 1] = val;
                 compressed diag[0].range(to,from) = CENTER;
                 directionDiagonal[index] = CENTER;
81
             databaseLocalIndex ++;
             from -= 2:
84
             to -= 2;
86
87
```

```
Evoid store diagonal (int directions index, ap uint<512> *direction matrix g, ap uint<512> compressed diag[1]) {
26
27
        memcpy(direction matrix q + directions index, compressed diag, sizeof(ap uint<512>));
29
30 ⊟short get(char data[], int key) {
        const int position = (key % 4) * 2;
        key /= 4;
       char mask = 0;
34
       mask &= 000000000;
       mask |= 3 << position;
36
                                                            Host 解讀2 bit 編碼的資料需透過 shift與mask運算。
       char fin mask =0;
39
        fin mask&= 00000000;
40
41
        fin mask |= 3 \ll 0;
42
        return (((data[key] & mask) >> ( position)) & fin mask);
```

Name	Issue Type	Latency (cycles)	Latency (ns)	Iteration Latency	Interval	Trip Count	Pipelined	BRAM	BRAM (%)	DSP	DSP (%)	FF	FF (%)	LUT	LUT (%)	Slack
compute_matrices		504	1.680E3		505		no	60	2	0	0	16389	~0	200829	23	0.00
C Loop 1		167	557.000	73	1	95	yes									
C init_dep_for		65	217.000	1	1	65	yes									
C num_diag_for		128	427.000	3	1	127	yes									

優化內容:

- 先將由AXI-master傳輸的query和database儲存於FPGA上的string1與string2。
- 反對角線方向的運算 unroll後可以同時執行, 最多可以有效計算 N個值。
- 需要回傳的directions經過 2 bit 壓縮編碼,可減少數據傳輸量。

input compression

33 Evoid set char main (unsigned int * array, int index, unsigned char val) {

```
switch (val) {
           case 'A': array[index / \frac{16}{16}] = (0 << ((index % \frac{16}{16}) * 2));
                                                                     DNA有ATCG 4種鹼基對,RNA有AUCG 4種鹼基對。
           case 'C' : array[index / 16] |= (1 << ((index % 16) * 2));</pre>
                                                                     無論分析DNA或RNA皆可只用 2 bit 表示一種鹼基對。
           case 'G': array[index / 16] |= (3 << ((index % 16) * 2));
           break;
           case 'T' : array[index / 16] |= (2 << ((index % 16) * 2));</pre>
42
           break;
43
44
45
         ap uint<512> string1[N / NUM ELEM + 1];
     //#pragma HLS ARRAY PARTITION variable=string1 complete dim=1
         ap uint<512> string2[(DATABASE SIZE) / NUM ELEM + 1];
     //#pragma HLS ARRAY PARTITION variable=string2 complete dim=1
                                                                              可節省空間與傳輸量
     // short direction matrix[DIRECTION MATRIX SIZE];
     //#pragma HLS ARRAY PARTITION variable=direction matrix complete dim=1
         memcpy(string1, string1 g, (N/NUM ELEM + 1) * 64);
        memcpy(string2, string2 g, ((DATABASE SIZE) / NUM ELEM + 1) * 64);
114
             const short q = string1[index/NUM ELEM].range((index%NUM ELEM) * 2 + 1, (index%NUM ELEM) * 2);
             short db = string2[databaseLocalIndex/NUM ELEM].range((databaseLocalIndex%NUM ELEM) * 2 + 1, (databaseLocalIndex%NUM ELEM) * 2);
```

在硬體中可以直接獲得指定位置的 bit value, 因此不需要額外時間做解碼。

input compression

優化前 (systolic array):

Name	Issue Type	Latency (cycles)	Latency (ns)	Iteration Latency	Interval	Trip Count	Pipelined	BRAM	BRAM (%)	DSP	DSP (%)	FF	FF (%)	LUT	LUT (%)	Slack
compute_matrices		504	1.680E3		505		no	60	2	0	0	16389	~0	200829	23	0.00
C Loop 1		167	557.000	73	1	95	yes									
C init_dep_for		65	217.000	1	1	65	yes									
C num_diag_for		128	427.000	3	1	127	yes									

優化後 (systolic array + input compression):

Name	Issue Type	Latency (cycles)	Latency (ns)	Iteration Latency	Interval	Trip Count	Pipelined	BRAM	BRAM (%)	DSP	DSP (%)	FF	FF (%)	LUT	LUT (%)	Slack
compute_matrices		337	1.123E3		338		no	60	2	0	0	12307	~0	459216	52	0.00
C init_dep_for		65	217.000	1	1	65	yes									
C num_diag_for		129	430.000	4	1	127	yes									

優化內容:

將string1 與 string2 壓縮編碼,節省空間與傳輸量。

string1與string2壓縮後, 長度各為1個ap_uint<512>, 因此Loop1(memcpy)縮短為2 cycle。

修改前:

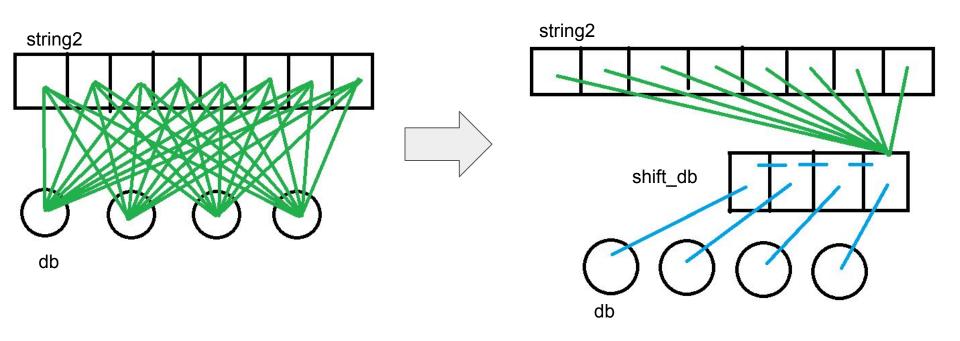

```
num diag for: for (int num diagonals = 0; num diagonals < N + M - 1; num diagonals++) {
140
      #pragma HLS inline region recursive
141
      #pragma HLS PIPELINE
143
              calculate diagonal (num diagonals, string1, string2, northwest, north, west, directions index, compressed diag);
              store diagonal (directions index, direction matrix q, compressed diag);
144
145
              directions index ++;
         int databaseLocalIndex = num diagonals;
         int from, to;
         from = N * 2 - 2;
         to = N * 2 - 1:
40
41
42
         calculate diagonal for: for (int index = N - 1; index >= 0; index --) {
             int val = 0:
43
             const short q = string1[index/NUM ELEM].range((index%NUM ELEM) * 2 + 1, (index%NUM ELEM) * 2);
44
             short db = string2[databaseLocalIndex/NUM ELEM].range((databaseLocalIndex%NUM ELEM) * 2 + 1, (databaseLocalIndex%NUM ELEM) * 2);
45
             databaseLocalIndex ++;
             from -= 2;
86
             to -= 2;
87
```

原本string2的起始index隨著num_diagnals增加而增加,因此db存取的index會隨時間變化。

修改後:

```
num diag for: for (int num diagonals = 0; num diagonals < N + M - 1; num diagonals++) {
      #pragma HLS inline region recursive
      #pragma HLS PIPELINE
               calculate diagonal (num diagonals, string1, string2, northwest, north, west, directions index, compressed diag, shift db, direction matrix g);
               update database (string2, shift db, num diagonals);
               store diagonal (directions index, direction matrix q, compressed diag);
               directions index ++;
51
          int databaseLocalIndex = 0;
         int from, to;
          from = N * 2 - 2;
54
          to = N * 2 - 1:
                                                                                     string2透過shift db做媒介, 起始index固定在0。
                                                                                    存取的index固定,不隨時間變化。
56
          calculate diagonal for: for (int index = N - 1; index >= 0; index --) {
              int val = 0;
              const short q = string1[index/NUM ELEM].range((index%NUM ELEM) * 2 + 1, (index%NUM ELEM) * 2);
              unsigned int db = shift db[databaseLocalIndex/NUM ELEM].range((databaseLocalIndex % NUM ELEM) * 2 + 1, (databaseLocalIndex % NUM ELEM) * 2);
33 Evoid update database (ap uint<512> *database, ap uint<512> *shift db, int num diagonals) {
34
        int startingIndex = N + num diagonals;
        update database: for (int i = 1; i < N; i++) {
    #pragma HLS PIPELINE
           shift db[(i-1)/NUM ELEM].range(((i-1)%NUM ELEM)*2+1, ((i-1)%NUM ELEM)*2) = shift db[i/NUM ELEM].range((i%NUM ELEM)*2+1, (i%NUM ELEM)*2);
           //set char(shift db, i-1, get char(databaseLocal, i));
           //databaseLocal[i-1] = databaseLocal[i];
41
        shift db[(N-1)/NUM ELEM].range(((N-1)%NUM ELEM) * 2 + 1, ((N-1)%NUM ELEM) * 2) = database[startingIndex/NUM ELEM].range((startingIndex%NUM ELEM) * 2 + 1, (startingIndex%NUM ELEM) * 2);
        //set 2bit(shift db, N-1, get 2bit(database, startingIndex));
43
        //set char(shift db, N-1, get char(database, startingIndex));
                                                                 shift db作為一個滑動的窗口。
        //databaseLocal[N-1] = database[startingIndex];
```

data傳輸網路圖

優化前 (systolic array + input compression):

Name	Issue Type	Latency (cycles)	Latency (ns)	Iteration Latency	Interval	Trip Count	Pipelined	BRAM	BRAM (%)	DSP	DSP (%)	FF	FF (%)	LUT	LUT (%)	Slack
compute_matrices		337	1.123E3		338		no	60	2	0	0	12307	~0	459216	52	0.00
C init_dep_for		65	217.000	1	1	65	yes									
C num_diag_for		129	430.000	4	1	127	yes									

優化後 (systolic array + input compression + shift register):

	_			•												
Name	Issue Type	Latency (cycles)	Latency (ns)	Iteration Latency	Interval	Trip Count	Pipelined	BRAM	BRAM (%)	DSP	DSP (%)	FF	FF (%)	LUT	LUT (%)	Slack
compute_matrices	II Violation	25354	8.451E4		25355		no	60	2	0	0	19376	1	211583	24	0.00
C init_dep_for	•	65	217.000	1	1	65	yes									
→ C num_diag_for		25146	8.381E4	198		127	no									
C calculate_diagonal_for		66	220.000	3	1	64	yes									
C update_database	II Violation	126	420.000	2	2	63	yes									

可看到總Latency大幅增加! update_database出現II violation (原先認為此處應該unroll)

```
void update database(ap uint<512> *database, ap uint<512> *shift db, int num diagonals){
34
                                           int startingIndex = N + num diagonals;
                                           update_database:for(int i = 1; i < N; i++){
35
                 #pragma HLS PIPELINE
36
                                                                      shift db[(i-1)/NUM ELEM].range(((i-1)%NUM ELEM)*2+1, ((i-1)%NUM ELEM)*2) = shift db[i/NUM ELEM].range((i%NUM ELEM)*2+1, (i%NUM ELEM)*2);
37
                                                                      //set_char(shift_db, i-1, get_char(databaseLocal, i));
38
39
                                                                      //databaseLocal[i-1] = databaseLocal[i];
40
                                           shift_db[(N-1)/NUM_ELEM].range(((N-1)%NUM_ELEM) * 2 + 1,((N-1)%NUM_ELEM) * 2) = database[startingIndex/NUM_ELEM].range((startingIndex%NUM_ELEM) * 2 + 1, (startingIndex%NUM_ELEM) * 2 + 1, (startingIndex%NUM_ELEM
41
42
                                           //set 2bit(shift db, N-1, get 2bit(database, startingIndex));
43
                                           //set_char(shift_db, N-1, get_char(database, startingIndex));
                                           //databaseLocal[N-1] = database[startingIndex];
45
```

原因:

在update_database裡面出現 #pragma HLS PIPELINE,因此判斷是此pragma誤導Vitis HLS。因為上層num_diag_for已經切pipeline,因此會盡量讓下層的 update_database平行或unroll,但是update_database下面多了#pragma HLS PIPELINE,使update_database的for loop無法被unroll,造成II vioilation。

解決方法:

我們將其註解調並重新合成。

優化前 (systolic array + input compression):

, ,		_	-	•							1					4
Name	Issue Type	Latency (cycles)	Latency (ns)	Iteration Latency	Interval	Trip Count	Pipelined	BRAM	BRAM (%)	DSP	DSP (%)	FF	FF (%)	LUT	LUT (%)	Slack
compute_matrices		337	1.123E3		338		no	60	2	0	0	12307	~0	459216	52	0.00
C init_dep_for		65	217.000	1	1	65	yes				(
C num_diag_for		129	430.000	4	1	127	yes									

優化後 (systolic array + input compression + shift register):

Name	Issue Type	Latency (cycles)	Latency (ns)	Iteration Latency	Interval	Trip Count	Pipelined	BRAM	BRAM (%)	DSP	DSP (%)	FF	FF (%)	LUT	LUT (%)	Slack
compute_matrices		337	1.123E3		338		no	60	2	0	0	13706	~0	118187	13	0.00
C init_dep_for		65	217.000	1	1	65	yes									
C num_diag_for		129	430.000	4	1	127	yes									

可發現雖然Latency與先前完全相同,但因為 shift register很容易於硬體實現,也簡化了資料傳輸,因此資源消耗量大幅降低。

嘗試不同硬體規模:

原配置: M與N分別為128與256, 此大小需要較多資源且合成極慢 (需要數個小時)。

```
18  #define N 256
19  #define M 128
20  #define NUM_ELEM 256
21  #define DATABASE_SIZE (M + 2 * (N - 1))
22  #define DIRECTION_MATRIX_SIZE ((N + M - 1) * N)
23  #define MATRIX_SIZE (N * M)
```

若只修改M與N的定義, 則其電路無法正確運作。 經分析後, 發現 code其他部分僅能在 N = 256與M = 128的條件下成立。

因此我們將code改寫能夠適應各種N與M的配置。

dual physical ports

130

131

```
void compute matrices( ap uint<512> *string1 g, ap uint<512> *string2 g, ap uint<512> *direction matrix g)
110
111
     #pragma HLS INTERFACE m axi port=string1 g offset=slave bundle=gmem0
112
     #pragma HLS INTERFACE m axi port=string2 g offset=slave bundle=gmem0
113
     #pragma HLS INTERFACE m axi port=direction matrix g offset=slave bundle=gmem1
114
     void compute_matrices( ap_uint<512> *string1_g, ap_uint<512> *string2_g, ap_uint<512> *direction_matrix_g)
110
111
     #pragma HLS INTERFACE m_axi port=string1 g offset=slave bundle=gmem@
112
     #pragma HLS INTERFACE m axi port=string2 g offset=slave bundle=gmem1
113
     #pragma HLS INTERFACE m_axi port=direction matrix g offset=slave bundle=gmem2
114
       memcpy(string1, string1 g, (N/NUM ELEM + 1) * 64);
       memcpy(string2, string2 g, ((DATABASE SIZE) / NUM ELEM + 1) * 64);
```

原本string1_g與string2_g為同一個bundle, 因此資料依序傳輸。 將string1_g跟string2_g設為不同的bundle以實現dual physical ports, 同時傳輸兩者資料。

dual physical ports

優化前 (systolic array + input compression + shift register):

Name	Issue Type	Latency (cycles)	Latency (ns)	Iteration Latency	Interval	Trip Count	Pipelined	BRAM	BRAM (%)	DSP	DSP (%)	FF	FF (%)	LUT	LUT (%)	Slack
compute_matrices		337	1.123E3		338		no	60	2	0	0	13706	~0	118187	13	0.00
C init_dep_for		65	217.000	1	1	65	yes									
C num_diag_for		129	430.000	4	1	127	yes									

優化後 (systolic array + input compression + shift register + dual phsical ports):

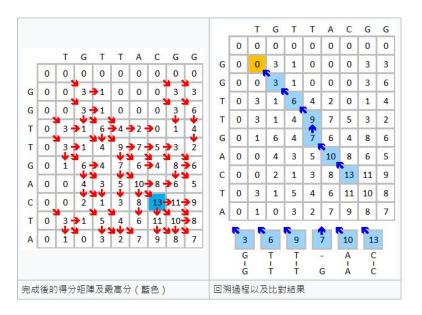

Name	Issue Type	Latency (cycles)	Latency (ns)	Iteration Latency	Interval	Trip Count	Pipelined	BRAM	BRAM (%)	DSP	DSP (%)	FF	FF (%)	LUT	LUT (%)	Slack
compute_matrices		336	1.120E3		337		no	90	3	0	0	15120	~0	119775	13	0.00
C init_dep_for		65	217.000	1	1	65	yes									
C num_diag_for		129	430.000	4	1	127	yes									

dual ports讓string1_g和string2_g可以同時傳,在本次實驗中 string1_g與string2_g長度皆為1個 ap_uint<512>,原先需要2個cycle,優化後僅需要1個cycle。

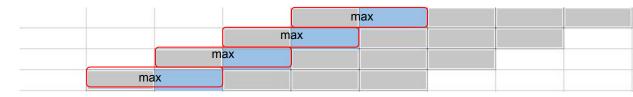

雖然看似只省去僅僅一個 cycle, 但在做scalable design時, string1_g和string2_g如果很大, 整體省下的 cycles還是很可觀的。

find max value index

在做smith-waterman時,不僅需要算direction maxtrix,還要算出哪裡有最大值,這樣才有辦法從最大值的那個點進行backtracking。

find max value index

```
249
           num diag for: for(int num diagonals = 0; num diagonals < N + host M - 1; num diagonals++) {
      #pragma HLS inline region recursive
       #pragma HLS PIPELINE
               calculate diagonal (num diagonals, string1, string2, northwest, north, west, directions index, compressed diag, shift db, direction matrix q);
254
               compare (num diagonals, north, max index, max value);
256
               update database (string2, shift db, num diagonals);
258
               store diagonal (directions index, direction matrix q, compressed diag);
259
               directions index ++;
260
               if(rest size > 0) {
261
                   if (num diagonals - (N-1) - tail >= NUM ELEM) {
                       memcpy(string2 + replace idx%3, string2 g + replace idx, 64);
263
                       tail += NUM ELEM;
                       replace idx++;
264
                                                                     void compare(int num diagonals, int north[N + \frac{1}{1}], int max index[N + \frac{1}{1}], int max value[N + \frac{1}{1}]){
                       rest size --;
                                                                         for (int i=0; i < N; i++) {
                                                                             if(north[i] > max value[i]){
                                                                                 max index[i] = num diagonals;
                                                                                 max value[i] = north[i];
269
           find max (max index, max value);
271
           memcpy (max value idx, max index, sizeof(int));
```

針對每條對角線,我們會對此對角線與前一條對角線上N個值各別去做同位置的比大小,使得max_index都會存所有目前對角線上N個最大值的index。

find max value index

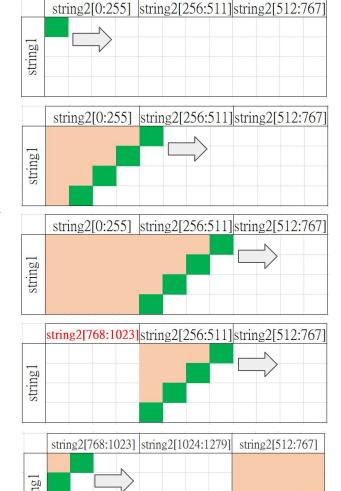

```
117 = void find max(int indexs[N + 1], int values[N + 1]) {
           #pragma HLS PIPELINE
           int max index 64[64], max index 32[32], max index 16[16], max index 8[8], max index 4[4], max index 2[2];
           int max value 32[32], max value 16[16], max value 8[8], max value 4[4], max value 2[2];
           for (int i=0; i<N; i++) {
               \max index 64[i] = indexs[i] * N + i;
           for (int i = 0; i < 32; i++) {
               if(values[i*2] >= values[i*2+1]){
                    max index 32[i] = \max index 64[i*2];
                    max value 32[i] = values[i*2];
               }else{
                    max index 32[i] = \max \text{ index } 64[i*2+1];
                    max value 32[i] = values[i*2+1];
           for (int i = 0; i < 16; i + +) {
               if (max value 32[i*2] >= max value <math>32[i*2+1]) {
                    max index 16[i] = \max index 32[i*2];
                    max value 16[i] = \max \text{ value } 32[i*2];
                    max index 16[i] = \max index 32[i*2+1];
                    max value 16[i] = \max \text{ value } 32[i*2+1];
           for (int i = 0; i < 8; i + +) {
               if (max value 16[i*2] >= max value <math>16[i*2+1]) {
                    max index 8[i] = \max index 16[i*2];
                    max value 8[i] = \max \text{ value } 16[i*2];
               }else{
                    max index 8[i] = \max index 16[i*2+1];
                    max value 8[i] = \max \text{ value } 16[i*2+1];
           for (int i = 0; i < 4; i + +) {
               if (max value 8[i*2] >= max value <math>8[i*2+1]) {
                    \max index 4[i] = \max index 8[i*2];
                    max value 4[i] = \max \text{ value } 8[i*2];
               }else{
                    max index 4[i] = \max index 8[i*2+1];
                    max value 4[i] = \max \text{ value } 8[i*2+1];
```

計算完所有對角線後, 我們會採用max tree, 搭配 pipleline, 分成6級運算, 以比較N個值中的最大值, 並取得max value index, 這樣傳回host就可以做 backtracking。

scalable design

```
int rest size = (host DATABASE SIZE+NUM ELEM-1)/NUM ELEM - 3;
          int replace idx = 3:
247
          int tail = \overline{0};
          num diag for: for(int num diagonals = 0; num diagonals < N + host M - 1; num diagonals++){
      #pragma HLS inline region recursive
      #pragma HLS PIPELINE
              calculate diagonal (num diagonals, string1, string2, northwest, north, west, directions
254
              compare (num diagonals, north, max index, max value);
              update database (string2, shift db, num diagonals);
              store diagonal (directions index, direction matrix g, compressed diag);
259
              if(rest size > 0) {
261
                  if (num diagonals - (N-1) - tail >= NUM ELEM) {
                      memcpy(string2 + replace idx%3, string2 q + replace idx, 64);
                      tail += NUM ELEM;
264
                      replace idx++;
                      rest size--;
```

原本硬體的kernel_N與kernel_M需與string1與string2的長度一致。 而在真實的smithwaterman應用中,序列長度不固定。 我們透過實作circular buffer,將string2分段讀取,即可在固定的硬體資源運算任意長度的string2 (database)。

28

final version

優化前 (systolic array + input compression + shift register + dual phsical ports):

																_

C init_dep_for		65	217.000	1	1	65	yes									
C num_diag_for				76	1		yes									

雖然scalable design比之前的design多出一倍多的運算資源,但是scalable design可以在不更改硬體的情況下,應付不同的database長度,且可算出max index。

Future Work

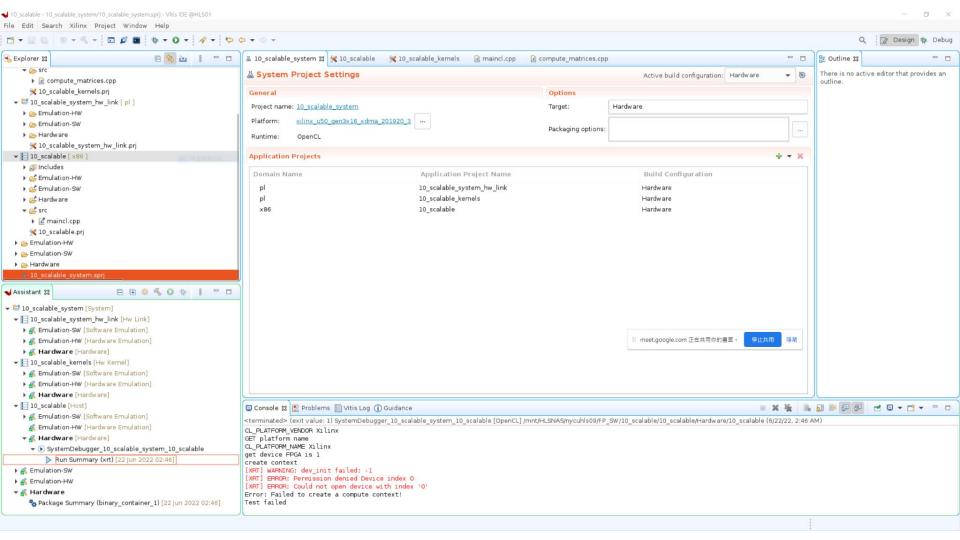

Fully scalable design:

需要使用到長度 = M - NCU的buffer儲存分割處的value。

(M = string2 length, NCU = number of compute unit)

```
